REPO ONE-PAGE SUMMARY

Baylio

AI call assistant for auto repair shops

Evidence-only summary
Generated from local repo files

WHAT IT IS

Baylio is a multi-tenant SaaS app that gives auto repair shops an AI receptionist. The repo shows a React/Vite dashboard and an Express/tRPC backend that connects Twilio calls to ElevenLabs voice agents, logs calls, analyzes outcomes, and manages billing.

WHO IT'S FOR

Primary: auto repair shop owners/operators who want 24/7 call answering, appointment capture, missed-call recovery, and visibility into call performance.

WHAT IT DOES

- Answers inbound shop calls through Twilio and an ElevenLabs conversational AI agent.
- Captures caller, vehicle, service, appointment, and upsell context.
- Shows dashboards for call logs, analytics, missed-call audits, notifications, integrations, and costs.
- Configures shops, phone numbers, voices, agent behavior, business hours, and service catalogs.
- Runs post-call transcription/classification, usage metering, SMS/email recaps, and scorecards.
- Handles Stripe checkout, billing portal, subscriptions, tiers, and webhook updates.
- Includes partner/admin portals plus Google, HubSpot, Sheets, and Shopmonkey service integrations.

HOW IT WORKS

React/Vite SPA: main, partner, and admin routes

v

tRPC client -> Express `/api/trpc` routers

v

Routers -> services -> Drizzle DB helpers

v

PostgreSQL schema via Drizzle; Supabase env vars present

- **Call path:** Twilio `/api/twilio` -> validation/rate limit -> context cache/prompt compiler -> ElevenLabs WebSocket -> post-call pipeline.
- **Billing path:** Stripe `/api/stripe` webhooks update subscriptions and usage records.
- **Repo conflict:** current code is PostgreSQL; older setup docs mention MySQL/TiDB.

HOW TO RUN

1. Install Node.js 20+ and pnpm 10+.
2. From repo root, run `pnpm install`.
3. Create `.env` with required service secrets.
4. Run `pnpm dev`. Other scripts: `pnpm build`, `pnpm test`, `pnpm db:push`.

RUN NOTES / GAPS

Env: docs list `DATABASE_URL`, `JWT_SECRET`, Twilio, ElevenLabs, and Stripe keys; code also references `SUPABASE_*` and `ANTHROPIC_API_KEY`.

Not found in repo: canonical `.env.example`; docs say copy secrets from the team vault.

Port mismatch: code defaults to `PORT || 3000`; setup docs say port 5000.

Evidence checked: README.md, package.json, docs/DEV_SETUP.md, docs/ARCHITECTURE.md, client/src/App.tsx, server/_core/index.ts, server/routers.ts, server/db.ts, drizzle.config.ts, drizzle/schema.ts, and source tree names. No external sources used.
